

METHODS AND APPARATUS FOR THREE-DIMENSIONAL GAMING

Abstract of the Disclosure

Methods and apparatus for three-dimensional gaming are disclosed. A three-dimensional casino game includes additional display layers, additional game options, and additional game evaluation methods over a traditional two-dimensional casino game. The three-dimensional casino game allows a player to select one or more three-dimensional game options such as how many layers to include in the game and which game positions are "staked." For example, in a video slot machine, the player may select three layers of reels and place a transparent stake indicator over the center reel position. The player's selections may determine one or more game evaluation methods and display modes. After one or more random numbers are generated, the outcome of the game is displayed three-dimensionally to the player based on the selected game evaluation methods and display modes. Many different game evaluation methods and payouts are possible in a three-dimensional casino game.
